Dear Ed,

I inspected the electrical system at the above referenced property on October 8, 2009.

The customer has a gas furnace in the attic that covers the whole house. It appears that at one time, there was electric heat in the house. There are four, 20 amp, double pole breakers that are labeled 'heat' in the panel. There was no evidence of any wall mount thermostats anywhere in the house. I am not sure what the circuit's labeled 'heat' went to.

The existing gas furnace has a 120 volt circuit feeding the blower.

Thank you!

  
Tom Evans  
President, Evans Electric Co, Inc
