

**Case No. 10-2368-EL-REN**  
**AUGLAIZE HYDROELECTRIC PLANT UNIT 3**  
**Staff Interrogatories – Second Set**

Question 1: Please provide 12 months of SCADA readings for Unit 3 for the year prior to repairs and retrofits and 12 months of SCADA readings after repairs and retrofits were completed. We would like to get an idea how much capacity has been added due to repairs and retrofits after January 1, 1998. It may be more accurate to look at a year's worth of data before and after the repairs/retrofits rather than a single day.

Answer 1: Bryan Municipal Utilities (BMU) submitted the highest twenty four hour average on the first set of interrogatories. By selecting the highest generation data for a shorter period of time, i.e. 24 hours, the amount of variables affecting the generation would be greatly reduced. There are multiple variables that have an affect on a "run of the river" hydroelectric plant. The Auglaize Hydroelectric Plant is influenced by head water level, tail water level, number of units online, ice, debris, flashboard condition and flood gate opening. Comparing one years generation with another will not be representative of the plants capacity due to the variability of the above factors.

With that said, I have attached generation data from our old SCADA system for the year that we have SCADA data. This data is from a period before retrofits were in place. Also attached is a spread sheet of the most recent generation data from our new SCADA with retrofits in place. The spread sheet for the most recent data is auto-generated by the SCADA system with the exception of column "D" which was added as a calculation to determine the 24 hour generation in kWh.

I also included a spread sheet comparing 120 days of generation from 2002 to 2010. The generator output for each year is sorted from highest to lowest daily kWh output. Then the difference between 2010 and 2002 was calculated. For the first 49 days of the highest daily output, generation was greater in 2010 than in 2002. There were 71 days when unit #1 was not operated in 2002.

Question 2: How much of the added capacity after the post-1998 repairs and retrofits is due to maintenance that would have been performed due to normal maintenance? That is, can you delineate capacity that was added because you wanted to increase capacity from any increases that may have occurred due to regular maintenance? For example, retrofits that were performed that increased the amount of head on the generator don't seem to be normal preventative maintenance. However, rewinding the generators might be something that is done on a regular basis. So if rewinding is something that has to be done periodically and if by doing so capacity is increased, not just restored, please state how much of the added capacity is due to normal maintenance?

Answer 2: All the capacity increase for this unit was due to Bryan Municipal Utilities opting to replace the exiting unit with a more efficient unit. This is especially true in high tail waters. The unit we replaced was terribly inefficient and worse in high tail waters. Prior to replacing this unit we attempted numerous maintenance efforts to improve the output and increase efficiency with no success.

The replacement unit installed is designed to match the current headwater conditions of the plant. The old unit was not designed for the current headwater conditions causing it to perform below its rated capacity. The increase in capacity was not due to maintenance items but due to replacing the old machine with a machine engineered to match the plants headwater conditions.

# Auglaize Hydroelectric Plant Daily Generation kWh for 120 days from Feb thru May 2002 & 2010

Values sorted largest to smallest

Unit #3

Difference = 2010 - 2002 values

	Greater Generation in 2010
	Less Generation in 2010
