## 2. General Regulations (Cont'd)

## 2.6 Definitions (Cont'd)

Basic Service Arrangement (BSA) (Cont'd) - The BSA is comprised of three elements, the Access Link, Transport and Features and Functions. The access link consists of facilities used to connect a customer designated premises to the serving wire center of that premises. This element contains the attributes inherent in the connection of a customer's designated premises to the point of network interconnection.

It will have alternative characteristics which can be selected by the customer, but one of which is necessary for communications transfer (e.g., 2-wire or 4-wire facilities). The features and functions element consists of fundamental capabilities resident in a customer serving wire center or a distant central office. It includes the routing and processing capabilities associated with the provision of end-to-end communications.

The transport element is the connection between central offices, such as serving wire center to another central office, where access to features and functions or end users is required. When the customer and end user are served from the same serving office, the transport element consists of an intraoffice connection.

Basic Service Element (BSE) - A BSE is an optional and unbundled network feature associated with a BSA. These features are specifically determined and developed based on the needs of enhanced service providers for use in provision of enhanced services, as defined in Amendment of Part 69 of the Commission's Rules, although they may be used by any interstate customer.

Billed Number Group - the NPA-NXX and/or RAO-0/1XX administered by the data owner.

Billed Number Screening (BNS) - data stored in the Telephone Company's Line Information Data Base stating whether the billed line automatically rejects, accepts or requires verification of calls billed as collect or third number.<sup>(1)</sup> Billed Number Screening also identifies Local Exchange Company public and nonworking telephone numbers and indicates whether a central office code is active or vacant. (N)

Bit - the smallest unit of information in the binary system of notation.

Broadcast Traffic – Ethernet frames that are forwarded to all stations on a virtual local area network using the broadcast address.

Business Day - the times of day that a company is open for business. This is 8:00 A.M. to 5:00 P.M., Monday through Friday.

Busy Hour Minutes of Capacity (BHMC) - the customer specified maximum amount of Switched Access Service and/or Directory Assistance Service access minutes the customer expects to be handled in an end office switch during any hour in an 8:00 A.M. to 11:00 P.M. period for the Feature Group and/or Directory Assistance Service ordered. This customer furnished BHMC quantity is the input data the Telephone Company uses to determine the number of transmission paths for the Feature Group and/or Directory Assistance Service ordered.

## (B) Restricted Coin Access (RCA)

## (d) Line Information Data Base Access

Line Information Data Base (LIDB) Service is provided by the Telephone Company to its customers in support of alternate billing services. Alternate billing services allow the customer's end users to bill calls to an account not necessarily associated with the originating line. LIDB Service supports alternate billing services. (D)

LIDB will contain a record for every working line number and Billed Number Group served by the Telephone Company. LIDB also contains Billed Number Screening (BNS) code restrictions for all working line numbers and Billed Number Groups. Other exchange carriers who may store their data in LIDB are requested to provide this data as well.

The LIDB downtime will be less than twelve hours per year. It is capable of processing up to 100 queries per second. In addition, the LIDB will provide a mean response time of no more than 0.25 to 0.5 seconds and shall not exceed 1.0 second for 99 percent of all messages.

The Telephone Company will use the data base administration system to update the LIDB information, e.g., add, delete, and modify customer accounts as customers move, become delinquent on their accounts, or order new service, on a daily basis.

Aggregators or other end users may contact their Telephone Company Business Office to confirm screening service(s) applied to their account.

To ensure the most accurate validation service possible, two audit procedures will be done. The first audit is performed seven nights a week to compare the data contained in the data base administration system and LIDB data. Any differences between these data are resolved the next business day. The second audit, which occurs at least yearly, compares the customer record files and the information contained in the data base administration system.

Customers must purchase Signal Transfer Point Access Service as described in Section 6.1.3(A)(4)(b) in LATA 358 (Chicago, Illinois) for LIDB Service. LIDB Service provides the customer's OSS (identified in the CCS network by an originating point code) access to billing validation data. The LIDB will receive and respond to Billed Number Screening queries as defined in Bellcore publication TR-TSV-000954 and TR-NWT-001149.

LIDB Service enables the following functions on an on-line, call-by-call basis:

1. Determine whether the billed line automatically rejects, accepts or requires verification of certain calls billed as collect or third number.<sup>(1)</sup> (N)
2. Determine whether the billed line is a Local Exchange Company public or nonworking telephone number.
3. Determine whether the central office code is active or vacant.
