SECTION 4 - DESCRIPTION OF SERVICE AND RATES, CONT'D.

4.10 ISDN Prime

Local ISDN-PRI is provisioned at the 1.544 Mbps rate via the Primary Rate Interface standard of the Integrated Services Digital Network (ISDN). Local ISDN-PRI provides the Customer with the capabilities of simultaneous access, transmission and switching of voice, data and imaging services via channelized transport.

- 4.10.1. Local ISDN-PRI Service Arrangement - One or more Service Configurations can be combined to create a Local ISDN-PRI Service Arrangement. Customers may have multiple Local ISDN-PRI Service Arrangements per location, however for each Service Arrangement one Service Configuration 1 must be included. The controlling D channel will always reside on Service Configuration 1.

The D channel is a 64 Kbps channel that carries signaling and control for the B channels. The capabilities of the D channel are contained within the Customer's Service Configuration.

- A. Service Configuration 1 - The first Service Configuration for any Local ISDN-PRI Service Arrangement must be a Service Configuration 1. Service Configuration 1 provides twenty-three (23) 64 Kbps B channels and one (1) primary 64 Kbps D signaling channel. The primary D channel is an-out-of band signaling channel used to control and route all of the B channel traffic within the Local ISDN-PRI Service Arrangement.

The bearer (or B) channels are used for information transfer between users. B channels provide the same features as Local Trunk Basic and Local Trunk DID. To receive the DID capability, Customers must order separately DID telephone numbers, as found herein.

SECTION 4 - DESCRIPTION OF SERVICE AND RATES, CONT'D.

4.10 ISDN Prime, (Cont'd.)

4.10.1. (Cont'd.)

- B. Service Configuration 2 - This configuration is only available in conjunction with Service Configuration 1. It provides an additional twenty-four (24) 64 Kbps B channels which are controlled by the D channel on Service Configuration 1. Multiple Service Configuration 2s may be associated with a Service Configuration 1 subject to switching equipment limitations.
- C. Service Configuration 3 - This configuration is also only available to subscribers who have a Service Configuration 1. It provides a backup 64 Kbps D channel and twenty-three (23) additional 64 Kbps B channels. The backup D channel will control and route all of the B channel traffic of a single PRI Service Arrangement in the event the D channel on the primary configuration (Service Configuration 1) fails. A maximum of one Service Configuration 3 may be included with each Local ISDN-PRI Service Arrangement. Service Configuration 3 is available subject to switching equipment capabilities.

SECTION 4 - DESCRIPTION OF SERVICE AND RATES, CONT'D.

4.10 ISDN Prime, (Cont'd.)

- 4.10.2. Optional Features: In addition to providing Local Exchange Services specified above, Local ISDN-PRI can be configured to support the following optional advanced ISDN features:

Selective Class of Call Screening: Allows the Customer to restrict outgoing calls to those that are charged to the called telephone number, a third number, or a calling card. This feature is available for voice and for call by call service only.

Caller ID - Name & Number: Allows the Customer to receive the originating caller's working telephone number and name provided this information is forwarded to the Company by the caller's Local Exchange and/or Long Distance Carrier.

Redirected Number: RCF allows all calls dialed to a telephone number equipped for RCF service to be automatically forwarded to another dialable telephone number. This service enables a customer to list a local directory number that is forwarded to a different city or exchange. Each RCF service allows for the forwarding of one call at a given time.

Back-up D Channel: Provides back-up for failed D channels under those circumstances where multiple ISDN Primes share a single D channel in the same trunk group. A predetermined Channel on another ISDN Prime within the same trunk group would automatically take over call control signaling for circuit switched voice and circuit switched data calls.

2 B Channel Transfer: Allows the ISDN Prime to connect two calls, transfer the call together and then release the parties from the ISDN Prime.

B Channel Packet Switched Data Service: Provides the ability to originate and receive Packet Data calls over a pre-designated 64 Kbps B channel. B channels used for packet switched service cannot be used for circuit switched voice or circuit switched data calls.

Circular Hunt: Searches for an idle B channel at either the last channel to have accepted a call or the last channel to have attempted to place a call. This allows all call attempts to move through the route list of available B channels within the trunk group in an ascending circular fashion, thus evenly distributing traffic through all channels in the trunk groups within the route list.
