BEFORE  
THE PUBLIC UTILITIES COMMISSION OF OHIO  
DIRECT TESTIMONY OF  
ROBERT W. BRADISH  
ON BEHALF OF  
OHIO POWER COMPANY

1    **I. PERSONAL DATA**

2    **Q.     PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

3    A.     My name is Robert W. Bradish. I am employed by American Electric Power Service  
4           Corporation (AEPSC), one of several subsidiaries of American Electric Power Company,  
5           Inc. (AEP). I am currently Vice President - Grid Development for AEPSC. My business  
6           address is 700 Morrison Road, Gahanna, Ohio 43230-6642.

7    **Q.     PLEASE BRIEFLY DESCRIBE YOUR EDUCATIONAL AND PROFESSIONAL**  
8           **BACKGROUND?**

9    A.     I received a Bachelor of Science – Electrical Engineering degree in May 1985, and a  
10           Master of Science – Electrical Engineering degree in December 1986, both from  
11           Clarkson University. I also received a Master of Business Administration degree from  
12           The Ohio State University in May 2001. I was employed by AEPSC in 1987 as an  
13           assistant engineer and progressed through several engineering grades to the senior  
14           engineer level. In 2001, I was promoted to Manager – Power and Transmission Market  
15           Analysis. In 2002, I became Director of the same group. In 2003, I was promoted to  
16           Vice President – Transmission and Market Analysis. From 2005 to 2010, I was Vice  
17           President – Market Operations in AEPSC’s Commercial Operations group. In May 2010,  
18           I assumed the position of Managing Director, Transmission Planning and Business

1 Development, where I was responsible for transmission planning and the origination,  
2 evaluation, and execution of strategic transmission investment opportunities in support of  
3 AEP's transmission business strategy. In January 2012, I assumed my current position. I  
4 am also president of Pioneer Transmission, LLC.

5 **Q. WHAT ARE YOUR PRIMARY AREAS OF RESPONSIBILITY?**

6 A. As Vice President - Grid Development, I am responsible for AEP transmission system  
7 planning and operations, which includes organizing and managing all activities related to:  
8 1) assessing the adequacy of AEP's transmission network to meet the needs of its  
9 customers in a reliable, cost effective and environmentally compatible manner; 2) the  
10 real-time operation of AEP's transmission assets in compliance with all applicable safety  
11 and reliability standards, contractual and tariff obligations and all federal, state and local  
12 regulations and laws; and 3) advanced technical/analytical studies in support of planning,  
13 engineering, design and operation of the AEP transmission system. I am also responsible  
14 for managing/coordinating AEP's Transmission Technology/Research and Development  
15 Program.

16 **Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY IN ANY REGULATORY**  
17 **PROCEEDINGS?**

18 A. Yes, I have testified before the Arkansas, Indiana, Michigan, Oklahoma and Virginia  
19 regulatory commissions.

20 **II. PURPOSE OF TESTIMONY**

21 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

22 A. The purpose of my testimony is to describe the results of a transmission planning impact  
23 study, which estimates the required transmission upgrades and related costs that would be

1 necessary if certain generating units (PPA Units) owned by AEP Generation Resources  
2 (AEPGR) are retired. I will also describe how this study is related to the Purchase Power  
3 Agreement (Affiliated PPA) and its relevance to AEP Ohio customers.

### 4 **III. GENERATION UNIT RETIREMENTS IMPACT ON AEP OHIO TRANSMISSION**

#### 5 **Q. HOW DOES THE RETIREMENT OF GENERATING UNITS IMPACT THE** 6 **TRANSMISSION SYSTEM?**

7 A. The retirement of large, baseload generating resources can significantly change the  
8 magnitude and direction of power flows on the transmission system. The major impacts  
9 from the retirement of the PPA Units include transmission constraints; loss of spinning  
10 reserves; and loss of reactive power to provide voltage support to the transmission grid.

11 Specifically, areas that have been historically net exporters of power may now be  
12 forced to import power from other areas of the system. These changes in power flows  
13 can result in constraints.

14 Additionally, these units provide grid support in the form of spinning reserves and  
15 reactive power. The momentum created by the spinning generating units creates  
16 resistance to sudden changes caused by system disturbances. The spinning units can  
17 quickly react to adjust system voltage, frequency and power factor, which are also  
18 ancillary services provided by the generating units to PJM to support system reliability.

19 The transmission grid requires reactive power sources to maintain voltage levels  
20 and stability. Since baseload coal generation serves as the primary source of reactive  
21 power today, the loss of the PPA Units will also require replacement sources of reactive  
22 power. The coal-fired PPA Units can store a substantial amount of fuel on site, which  
23 helps maintain transmission grid reliability during adverse weather conditions, such as

1 the Polar Vortex experienced in PJM in January of 2014 and similar frigid temperatures  
2 that occurred in early 2015.

3 **Q. DOES THE GEOGRAPHIC LOCATION OF A PLANT IMPACT RELIABILITY**  
4 **AND WHY?**

5 A. Yes. The geographic location of a plant determines how power flows across the system  
6 from generation to load. When a plant is removed from the system, the specific location  
7 that was historically an exporter of power now must import power from other parts of the  
8 system to maintain the balance of supply and demand. Additionally, the reactive power  
9 the generator supplied that supports voltage is no longer available, leading to voltage  
10 stability concerns. The abrupt change brought on by retiring major baseload generating  
11 plants can cause serious swings in power flows and reactive power deficiencies that must  
12 be mitigated.

13 Central Ohio is particularly sensitive to this imbalance, as most generation in  
14 Ohio is located along Lake Erie or the Ohio River. A major exception is Conesville,  
15 which was designed to supply power to much of Central Ohio including Columbus. The  
16 retirement of Conesville would eliminate the last remaining major baseload generating  
17 plant in Central Ohio, leaving a major population susceptible to reliability risks.

18 **Q. DO THE PPA UNITS HAVE ANY USE IN MAINTAINING RELIABILITY?**

19 A. Yes. These plants provide necessary services, such as dynamic voltage and frequency  
20 regulation, which are essential to the transmission system's functionality. While the  
21 transmission upgrades would mitigate identified NERC reliability standard violations,  
22 they would not necessarily cover all potential scenarios where the plants may be required  
23 to maintain system stability. As more renewable and resources are added to the grid, the

1 ability of plants to re-dispatch in real-time is key to maintaining reliability while allowing  
2 these variable resources to operate. The fewer options available, the more the grid is  
3 susceptible to swings in power flows, voltage, and frequency that can lead to system  
4 instability.

5 **Q. WOULD THE PJM PROCESS FOR EVALUATING GENERATOR**  
6 **DEACTIVATIONS PREVENT RELIABILITY ISSUES?**

7 A. No, the PJM process does not prevent reliability issues, but provides a mechanism for  
8 evaluating the impacts, determining what reliability issues are anticipated, and assessing  
9 what transmission upgrades are required as mitigation. While the PJM process does  
10 allow for generator owners to enter into a Reliability Must Run (RMR) contract to  
11 mitigate short-term reliability issues, this contract is only necessary when mitigation  
12 cannot be completed by the date the unit is scheduled to retire. In other words, an RMR  
13 designation demonstrates the significant role a generator plays in maintaining reliability  
14 and only reinforces the need for the transmission upgrades. Additionally, since there is  
15 no obligation for a generator owner to accept an RMR designation, the reliability of the  
16 grid is still at risk if the transmission upgrades are not pursued in a timely manner.

17 **Q. IS IT POSSIBLE TO IDENTIFY AND IMPLEMENT TRANSMISSION**  
18 **UPGRADES RESULTING FROM GENERATION RETIREMENT IN A TIMELY**  
19 **MANNER?**

20 A. Yes, the improvements can be identified. However, one can never be certain that the  
21 transmission improvements can be implemented. Required regulatory approvals and  
22 permits, rights-of-way acquisition, long lead times for the purchase and installation of  
23 major equipment, environmental considerations, and scheduling equipment outages to

1 facilitate safe construction all impact project time lines. Major system upgrades often  
2 take several years to plan, design, and construct and may be challenging to complete prior  
3 to the time plants are scheduled to shut down.

4 **Q. ARE THERE TRANSMISSION SOLUTIONS TO MITIGATE THE EXPECTED**  
5 **IMPACTS FROM THE RETIREMENT OF THE PPA UNITS?**

6 A. Yes. Upgrading the transmission system can be used to mitigate the impacts from the  
7 retirement of the PPA units. By upgrading the transmission system, remaining available  
8 generation from within and outside the state of Ohio can serve AEP Ohio's customers.  
9 The purpose of the Affiliated PPA is to avoid the possible closure of certain generating  
10 units, and thereby, maintain sufficient generation within Ohio to meet the forecasted load  
11 needed to serve AEP Ohio's customers. The focus of my testimony will be to provide an  
12 analysis of the transmission upgrades and the associated costs that will be incurred if the  
13 PPA Units are retired.

14 **IV. TRANSMISSION PLANNING IMPACT STUDY**

15 **Q. WHAT AEPGR OHIO GENERATING UNITS ARE EXPECTED TO RETIRE**  
16 **FOR THE PURPOSE OF YOUR STUDY?**

17 A. AEP Transmission Planning performed a preliminary analysis of the scenario in which  
18 Cardinal 1, Conesville 4, 5, and 6, Stuart 1, 2, 3, and 4, and Zimmer 1 generating units  
19 are assumed retired. Equivalent generation, with signed interconnection or facility study  
20 agreements, needed to make up for the loss of the retired units was modeled based on the  
21 PJM interconnection queue. The analysis was performed on PJM RTEP Cases using  
22 Siemens PTI PSS/E and PowerGem TARA software. PJM Interconnection, LLC (PJM)  
23 is the regional transmission organization (RTO) with operational control of the eastern

1 AEP transmission system. It should be noted that all PJM generating units proposed to  
2 retire in mid-2015 have also been retired in the case, and the related transmission system  
3 upgrades approved by PJM in 2012 are modeled in-service.

4 **Q. WHAT ASSUMPTIONS WERE USED TO ASSESS THE IMPACT OF THE**  
5 **GENERATION RETIREMENTS ON THE TRANSMISSION SYSTEM?**

6 A. The same power flow models, assumptions, and methodology utilized by PJM to evaluate  
7 the reliability performance of the regional transmission system were utilized in the AEP  
8 study. Load flow analysis to determine potential overloads included single and common  
9 mode contingencies (N-1), Generation Deliverability, and N-1-1 assessments on the 2019  
10 PJM Regional Transmission Expansion Plan summer peak case and similar analyses on  
11 the 2017 PJM light load case. The 2019 summer peak case was also used to evaluate  
12 voltage performance under the same conditions. AEP and PJM planning criteria, which  
13 are based on NERC planning standards, were the basis for determining reliability  
14 violations that would require mitigation.

15 **Q. PLEASE DESCRIBE THE PRELIMINARY ASSESSMENT AS A RESULT OF**  
16 **THE STUDY.**

17 A. AEP's preliminary assessment has determined that both thermal overloads and low  
18 voltage conditions result following the retirement of the generating units. In some cases,  
19 the power flow models did not converge, which is an indication of severe system  
20 reliability concerns. Since the AEP transmission system serves as a thoroughfare for  
21 PJM, power flows change significantly in magnitude and direction, depending on the  
22 conditions modeled. For example, under peak conditions, the AEP transmission system  
23 is typically utilized to transport power from areas in the west to areas north and east of

1 the AEP system. Under light load conditions, power flows primarily from west to east  
2 and south of the AEP system as a result of increased wind generation, pump loads at  
3 hydro storage facilities, and reduced natural gas generation during off-peak hours. The  
4 variability of these factors, combined with the loss of centrally-located baseload  
5 generation sources, create vastly different stresses that must be accounted for in  
6 maintaining a reliable transmission system.

7 The results are indicative of the thermal overloads and voltage issues that are  
8 anticipated in the PJM analyses. Thermal overloads were found in different areas across  
9 the transmission system, demonstrating the broad impact of these units to regional  
10 reliability. The low voltage conditions that persisted indicate the resulting impact of the  
11 loss of major reactive power sources. The most serious conditions are in Ohio, as would  
12 be expected given the location of the generating units. Multiple facilities at 765 kV, 345  
13 kV, 138 kV, and lower voltages are affected. Additionally, facilities on neighboring  
14 utilities' transmission systems were similarly impacted.

## 15 **V. AEP OHIO TRANSMISSION MITIGATION REQUIREMENTS**

### 16 **Q. WHAT TRANSMISSION UPGRADES WOULD BE NECESSARY TO** 17 **MITIGATE THE IMPACT OF THE GENERATION UNIT RETIREMENTS?**

18 A. To mitigate these impacts, AEP would need to modify and upgrade its transmission  
19 system in Ohio and surrounding states. While some additional rigor is required to  
20 determine what solutions would ultimately be developed, AEP tested several upgrades  
21 that would mitigate the reliability issues. The upgrades include a new 765 kV line,  
22 several 765 kV and 345 kV substations, rebuild of existing 138 kV lines, and addition of

1 new reactive power sources such as capacitor banks and Static Var Compensators  
2 (SVCs).

3 **Q. WHAT IS THE ESTIMATED COST OF THE TRANSMISSION UPGRADES?**

4 A. The estimated cost for the minimum upgrades required is \$1.6 billion. This cost does not  
5 include any upgrades to neighboring utilities' transmission systems, so it can be expected  
6 that the eventual cost for all required upgrades will be higher. Approximately \$850  
7 million of the upgrades are expected to be at voltages 345 kV and below, the cost of  
8 which will be borne directly by customers in the AEP zone. Fifty percent of the  
9 remaining \$750 million may be shared with other PJM members if 765 kV options are  
10 approved as baseline upgrades.

11 **Q. WHAT IMPACT WOULD THE TRANSMISSION UPGRADES HAVE ON**  
12 **RELIABILITY DURING CONSTRUCTION?**

13 A. Scheduling outages of existing facilities is required to allow for safe construction,  
14 particularly if the lines or substation equipment are being replaced in the same location.  
15 While these facilities are out-of-service, the overall system is less reliable.

16 Long duration outages will be required to complete transmission upgrades  
17 resulting from potential generation retirements. Overlapping outages affecting multiple  
18 companies/areas is also a challenge, as AEP, First Energy, and other neighboring utilities  
19 often must upgrade their respective systems during the same time frames. PJM and AEP  
20 Transmission Operations work closely to ensure the grid remains reliable at all times, and  
21 often this means delay or cancellation of construction outages if warranted by system  
22 conditions. Thus, there are reliability risks during construction outages, but also future

1 risks if these outages are delayed or cancelled and the upgrades are not able to be  
2 completed in time.

3 **Q. ARE THERE OTHER FACTORS THAT COULD IMPACT THE**  
4 **TRANSMISSION UPGRADE REQUIREMENTS?**

5 A. Yes. This analysis only considered the impacts resulting from the specific units listed  
6 above. As studies showed from the last round of generation retirements in 2012, the  
7 combined impact of retiring AEPGR generating plants and neighboring utilities' plants  
8 creates a more severe scenario. The impact of the combined retirements in the PJM  
9 region announced to date has required nearly \$3 billion in upgrades. Similarly, it is  
10 expected that the collective impact of additional at-risk generation would require  
11 upgrades beyond those considered in an analysis that considers the specific AEP units in  
12 isolation.

13 **Q. PLEASE SUMMARIZE HOW THE GENERATION UNIT RETIREMENTS IN**  
14 **THIS STUDY WILL IMPACT AEP OHIO'S CUSTOMERS.**

15 A. The primary impact to AEP Ohio's customers from the continued retirement of  
16 generating units in Ohio is the future cost and reliability of electric service. Without the  
17 Affiliated PPA, the retirements of the PPA Units identified in the aforementioned  
18 transmission upgrade study could occur, in addition to the generation units already  
19 scheduled for retirement in mid-2015. The Affiliated PPA would keep the PPA Units  
20 operating to hedge the potential cost volatility of market-based electricity. In addition,  
21 the continued retirement of generating units in Ohio would necessitate construction of  
22 costly transmission upgrades to maintain transmission system reliability and enable  
23 importation of replacement power to serve AEP Ohio's customers.

1    **Q.     DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

2    **A.     Yes it does.**

## **CERTIFICATE OF SERVICE**

The undersigned hereby certifies that a true and correct copy of Ohio Power Company's *Pre-Filed Direct Testimony of Robert W. Bradish* have been served upon the below-named counsel and Attorney Examiners by electronic mail to all Parties this 15<sup>th</sup> day of May, 2015.

/s/ Steven T. Nourse
