COMMENT DESCRIPTION:

Energy Efficiency Programs and End Result(s) I would argue that adding distributed generation at the consumer level equates to an increase in efficiency when referencing the grid. If all customers on a radial distribution line added solar panels, the resulting power flow on the line would be reduced (and is a sustained reduction). The end result is the same as if all the customers increased efficiency of their energy usage. The intent is not dishonesty but to clarify the end result, which is reduced power demand on the grid.
