Hello once again, I just found this article or statement I should say by the world health organization I was hesitant to include it in my testimony on the fifth but once I found this, it was a little alarming in August 4, 2016 after further research, the world health organization states that low frequency, electromagnetic fields can induce circulating currents throughout the body and, depending upon the strength of these currents, it can stimulate nerves, muscles and affect biological processes. In short they caused disturbances to the human body now if you look on a pro solar site, quite the contrary, because where I found it was a neutral site on magnetic fields, but in reference within the topic of solar panels, the same world health organization says does no affect on human health. Now you see why I was hesitant to state anything further at August 5 but, we have to remember according to her toaster theory the science lady as I stated, there is now an additional 550 acres of this low frequency electromagnetic fields as I stated, along with radiant heat back into the atmosphere that didn't exist at these locations of the proposed project, we can't be naïve to the fact that frequencies, depending upon their range are used in many ways, some for a national defense, some actually for healing, so to say that it's clear and concise that additional low frequency magnetic fields are not an issue. I think this information begs to differ. Thank you.
